

Summary :

In this assignment, I worked with the Superstore dataset using the Pandas library in Python. First, I loaded the CSV file into a DataFrame and explored the data by checking the first and last few rows, the number of rows and columns, the column names, and the data types. This helped me understand the structure of the dataset.

Next, I checked for missing values and handled them by filling numerical columns with their average values and text columns with "Unknown" wherever required. I also filtered the data based on sales, selected only the required columns, and removed duplicate records to improve the quality of the dataset.

After cleaning the data, I created a new column called total_amount using the formula $\text{Price} \times \text{Quantity}$. Finally, I saved the cleaned dataset as cleaned_superstore.csv.

Overall, this assignment helped me understand the basics of data exploration and data cleaning using Pandas. I learned how to load datasets, inspect data, handle missing values, remove duplicates, create new columns, and save the processed data for further analysis.
